

## AMENDMENTS

### In the Specification

On page 3, immediately prior to the heading “DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT,” please add the following paragraph as follows:

Figure 6 illustrates a sample report, according to an embodiment.

On page 15, please amend the first full paragraph starting on line 4 as follows:

At block 500, a removable media storage container reader associated with the printer, such as the PC Card reader 332 in Figure 3 or the PC Card reader 426 in Figure 4, determines whether a removable media storage container, such as a PC Card, has been manually inserted and is available for reading. If not, the process terminates at block 502. If there is a PC Card in the PC card reader, then at block 504, the printer determines whether there is a file that is stored in the memory of the PC Card that has a format that is a recognized audio-visual (AV) format. The predetermined or recognized AV file formats can be stored in a memory area associated with the printer. If a file in the PC Card memory has a recognized AV file format, then the printer determines whether access to a network is available at block 506. By way of example, the network can be the network 406 seen in Figure 4 that is accessed by the printer through interface component 424. With respect to Figure 3 a network interface 314, in conjunction with user interface/menu browser 320, performs a similar function. If network access is

not available, then a listing is generated at block 508 from additional information that is stored with the encoded AV file on the PC Card according to the recognized AV file format. By way of example, the generated listing may contain the data [[see]] seen in Figure 1, reference numerals 114-2 through 114-7; also, see, e.g., Figure 6 which illustrates a sample report 512, according to an embodiment.
